## Core Concepts of Python Programming

To effectively harness Python's capabilities, one must understand its fundamental concepts.

## 1. Variables and Data Types

Variables are containers for storing data, and Python provides various data types:

- Numeric Types:
  - `int` (integers): e.g., `42`
  - `float` (floating-point numbers): e.g., `3.14`
- Text Type:
  - `str` (strings): e.g., `"Hello, World!"`
- Boolean Type:
  - `bool`: `True` or `False`
- Collection Types:
  - Lists, tuples, dictionaries, sets

Example:

```
```python
```

```
age = 25 integer
```

```
pi = 3.14159 float
```

```
name = "Alice" string
```

```
is_student = True boolean
```

```
```
```

## 2. Control Structures

Control flow dictates the execution order of code.

- Conditional Statements:

```
```python
```

```
if age >= 18:
```

```
    print("Adult")
```

else:

```
print("Minor")
```

```
'''
```

- Loops:

- `for` loops iterate over sequences:

```
```python
```

```
for i in range(5):
```

```
 print(i)
```

```
'''
```

- `while` loops execute as long as condition is true:

```
```python
```

```
count = 0
```

```
while count < 5:
    print(count)
```

```
    count += 1
```

```
'''
```

3. Functions and Modules

Functions are blocks of reusable code.

Defining a function:

```
```python
```

```
def greet(name):

 return f"Hello, {name}!"

 ...
```

Modules are files containing Python code, enabling code reuse and organization.

```
```python  
  
import math  
  
print(math.sqrt(16))  
  
    ...
```

4. Data Structures

Efficient data management is crucial.

- Lists: Ordered, mutable collections.

```
```python  

numbers = [1, 2, 3, 4]

numbers.append(5)

 ...
```

- Tuples: Immutable sequences.

```
```python  
  
coordinates = (10.0, 20.0)  
  
    ...
```

- Dictionaries: Key-value pairs.

```
```python
```

```
person = {"name": "Bob", "age": 30}
```

```
```
```

- Sets: Unordered collections of unique elements.

```
```python
```

```
unique_numbers = {1, 2, 3}
```

```
```
```
