Sample Midterm Exam Questions and Model Answers

To clarify expectations, here are common midterm questions with comprehensive answers, illustrating both the reasoning process and the correct solutions.

Question 1: Process Efficiency Calculation

"A manufacturing process has a cycle time of 20 minutes, with 3 workers operating simultaneously. The output rate is 12 units per hour. Calculate the process efficiency."

Answer:

Step 1: Determine the theoretical maximum output per hour.

- Since each unit takes 20 minutes, in 60 minutes, one worker can produce 3 units ($60 / 20$).
- With 3 workers, maximum capacity per hour = $3 \text{ workers} \times 3 \text{ units} = 9 \text{ units}$.

Step 2: Actual output is 12 units per hour, which exceeds the theoretical maximum. This indicates an inconsistency, suggesting a need to verify data.

Alternative approach:

- Given process cycle time and output, calculate efficiency.
- $\text{Efficiency} = (\text{Actual output rate} / \text{Theoretical maximum output rate}) \times 100$
- Theoretical maximum output rate: Number of units per hour based on cycle time for a single unit:

- 60 minutes / 20 minutes = 3 units per worker per hour.

- Total capacity with 3 workers: 3 workers $\times$ 3 units = 9 units/hour.

- Since actual output is 12 units/hour, which exceeds capacity, perhaps the data implies overlapping shifts or parallel processes.

Conclusion: Under typical circumstances, efficiency is calculated as:

Efficiency = (Actual output per hour / Theoretical maximum output per hour) $\times$ 100

Given the data inconsistency, students should verify inputs, but the key takeaway is understanding how to relate cycle time, workforce, and output.

Question 2: EOQ Calculation

"A company faces an annual demand of 10,000 units. The ordering cost per order is \$50, and the holding cost per unit per year is \$2. Calculate the Economic Order Quantity (EOQ)."

Answer:

Step 1: Recall the EOQ formula:

$$EOQ = \sqrt{(2 \times D \times S) / H}$$

Where:

- D = Annual demand = 10,000 units

- S = Ordering cost = \$50

- H = Holding cost per unit per year = \$2

Step 2: Plug in the values:

$$EOQ = \sqrt{(2 \times 10,000 \times 50) / 2}$$

$$= \sqrt{(1,000,000) / 2}$$

$$= \sqrt{500,000}$$

≈ 707.11 units

Conclusion: The optimal order quantity is approximately 707 units.

Question 3: Capacity Constraint Identification

"A factory has a maximum capacity of producing 500 units per day. The current demand forecast is 600 units per day. What strategies can be employed to meet this demand?"

Answer:

Identifying the capacity constraint: The factory cannot meet demand without adjustments.

Potential strategies include:

- Increase Capacity:
 - Add additional shifts or overtime.
 - Invest in faster machinery or automation.
 - Expand facilities.
- Adjust Demand:
 - Implement demand management strategies like pricing discounts or promotions during off-peak times.
 - Prioritize orders or segment customers based on capacity.

- Process Improvements:
- Lean manufacturing techniques to reduce waste and cycle times.
- Streamline workflows to increase throughput.
- Outsource or subcontract:
- Collaborate with external suppliers to fulfill excess demand.

Key takeaway: Combining capacity enhancement with demand management often yields the best results.

Les grands auteurs en logistique et supply chain : une plongée dans l'histoire et la pensée stratégique

La logistique et la gestion de la supply chain sont des disciplines essentielles à la compétitivité des entreprises modernes. Elles concernent l'optimisation des flux de matières, d'informations et de capitaux depuis l'approvisionnement jusqu'au client final. Au fil des décennies, cette discipline a été façonnée par de nombreux penseurs, chercheurs et praticiens, dont les travaux ont permis d'établir des fondements théoriques solides et d'innover constamment. Dans cet article, nous explorerons en profondeur les grands auteurs en logistique et supply chain qui ont marqué cette discipline, en analysant leur contribution, leur contexte historique et leur influence sur la pratique actuelle.

Introduction : La naissance d'une discipline stratégique

La logistique, longtemps considérée comme une simple fonction de gestion des flux physiques, s'est transformée au fil du temps en une discipline stratégique, intégrée à la gestion globale des entreprises. La complexité croissante des marchés, la mondialisation et l'innovation technologique ont motivé le développement d'un corpus théorique riche, porté par des auteurs de renom. Ces penseurs ont permis de formaliser des concepts, d'élaborer des modèles et de proposer des stratégies pour optimiser la chaîne d'approvisionnement.

Les figures fondatrices de la logistique et supply chain

Henry Ford et la standardisation

Bien que principalement connu pour ses innovations dans l'automobile, Henry Ford a influencé la logistique par sa mise en œuvre de la production de masse et la standardisation des pièces. Son approche a posé les bases de la gestion efficace des flux de production et de la conception de processus logistiques intégrés.

Peter Kraljic et la gestion stratégique des achats

Dans son article fondateur de 1983, « Purchasing Must Become Supply Management », Peter Kraljic introduit la matrice Kraljic, un outil stratégique pour analyser et gérer les achats. Il distingue quatre types d'achats en fonction de leur impact sur la profitabilité et leur complexité : leviers, goulots d'étranglement, non critiques et stratégies de routine. Sa contribution a profondément influencé la gestion stratégique des approvisionnements et la segmentation des fournisseurs.

Martin Christopher et la gestion de la supply chain

Martin Christopher, professeur à l'Imperial College London, est considéré comme l'un des pionniers de la pensée moderne en supply chain management. Son ouvrage clé, Logistics and Supply Chain Management (première édition en 1992), a popularisé la notion de supply chain comme un système intégré, insistant sur la nécessité de synchroniser flux physiques et informationnels pour créer de la valeur.

Les théories et modèles majeurs en logistique et supply chain

Le modèle SCOR (Supply Chain Operations Reference)

Développé par le Supply Chain Council (maintenant APICS), le modèle SCOR constitue une référence pour l'évaluation et l'amélioration des performances de la supply chain. Il repose sur cinq processus clés : planifier, approvisionner, produire, livrer et retourner. Ce cadre permet d'analyser, de mesurer et d'optimiser la performance globale.

La théorie des contraintes (TOC) ? Eliyahu M. Goldratt

Dans son ouvrage The Goal (1984), Goldratt introduit la théorie des contraintes, une approche systémique visant à identifier et éliminer le goulot d'étranglement limitant la performance d'un système. La TOC a été appliquée avec succès en logistique pour optimiser les flux, réduire les délais et améliorer la capacité globale.

Le lean management et le Just-In-Time (JIT)

Inspiré par le système de production de Toyota, le lean management a été popularisé par des auteurs comme James P. Womack et Daniel T. Jones dans leur ouvrage The Machine That Changed the World (1990). Le JIT, ou production à la demande, vise à minimiser les stocks et à éliminer les gaspillages dans la chaîne logistique, favorisant la flexibilité et la réactivité.

La gestion par la demande et la prévision

Des auteurs comme John T. Mentzer ont contribué à formaliser la gestion de la demande, en insistant sur la nécessité d'une planification précise pour réduire les incertitudes et optimiser les flux.

Les penseurs contemporains et leur influence

Martin Christopher et la résilience de la supply chain

Au-delà de la gestion classique, Martin Christopher a également insisté sur la résilience des chaînes d'approvisionnement face aux risques : catastrophes naturelles, crises sanitaires ou géopolitiques. Ses travaux encouragent une vision proactive pour rendre la supply chain plus flexible et résiliente.

Hau L. Lee et la gestion des risques

Hau L. Lee, professeur à Stanford, a développé des concepts liés à la gestion du risque et à la différenciation stratégique dans la supply chain. Il prône une gestion équilibrée entre la réduction des coûts et la sécurisation des flux.

Christopher S. Tang et la durabilité

Plus récemment, Christopher S. Tang a abordé la durabilité dans la supply chain, soulignant l'importance d'intégrer les enjeux environnementaux et sociaux dans la stratégie logistique, une tendance en forte croissance.

Les influences philosophiques et économiques

De nombreux auteurs en sciences économiques et gestion ont également façonné la pensée en logistique. Parmi eux :

- Michael Porter : ses travaux sur la stratégie concurrentielle et la chaîne de valeur ont influencé la conception de la supply chain comme un avantage compétitif.
- Alfred Chandler : sa théorie sur la structure organisationnelle a permis de comprendre l'intégration verticale et horizontale dans la gestion logistique.
- William J. Stein : ses études sur la gestion des stocks et la réduction des coûts ont été fondamentales dans l'optimisation opérationnelle.

Conclusion : Une discipline en constante évolution

Les grands auteurs en logistique et supply chain ont permis de transformer une fonction opérationnelle en un levier stratégique. Leur contribution ne se limite pas à la théorie : ils ont

influencé la pratique, façonné les modèles d'organisation et orienté les innovations technologiques comme l'intelligence artificielle, la blockchain ou la robotique.

Aujourd'hui, la discipline continue d'évoluer, intégrant des enjeux tels que la durabilité, la résilience et la digitalisation. La compréhension de leurs travaux reste essentielle pour toute organisation souhaitant optimiser sa chaîne d'approvisionnement dans un contexte globalisé et incertain. La richesse de la pensée de ces auteurs témoigne de l'importance d'une approche multidisciplinaire, combinant économie, gestion, ingénierie et technologie.

En résumé, la connaissance des grands auteurs en logistique et supply chain permet non seulement d'appréhender les fondements théoriques, mais aussi d'anticiper les tendances futures de cette discipline stratégique. Leur héritage constitue un socle indispensable pour toute recherche, pratique ou innovation dans ce domaine en constante mutation.
