Problem:

An isotope of uranium has a mass number of 238. How many neutrons does this isotope contain?

Solution:

- Atomic number of uranium (U) = 92
- Mass number (A) = 238
- Neutrons = $A - Z = 238 - 92 = 146$

Answer:

The isotope has 146 neutrons.

Example 2: Finding the Average Atomic Mass

Problem:

A sample contains 75% of Carbon-12 and 25% of Carbon-13. Calculate the average atomic mass of the sample.

Solution:

- Convert percentages to decimal fractions: 0.75 and 0.25
- Use the formula:

$$\text{Average mass} = (0.75 \times 12) + (0.25 \times 13) = 9 + 3.25 = 12.25 \text{ amu}$$

Answer:

The average atomic mass is 12.25 amu.

Example 3: Radioactive Decay

Problem:

A sample contains 100 grams of a radioactive isotope with a half-life of 10 hours. How much remains after 30 hours?

Solution:

- Number of half-lives passed = $30 / 10 = 3$
- Remaining amount = $100 \times (1/2)^3 = 100 \times 1/8 = 12.5$ grams

Answer:

12.5 grams of the isotope remain after 30 hours.

Sample Isotope Practice Questions with Answer Explanations

Below are sample questions and detailed solutions to illustrate how to work through isotope problems.

Question 1: Define an isotope and explain how isotopes of the same element differ.

Answer:

An isotope is an atom of the same element that has the same number of protons but a different number of neutrons. Isotopes of the same element differ in atomic mass but share identical chemical properties because they have the same number of electrons and protons.

Question 2: An element has two isotopes: one with an atomic mass of 35 u and abundance of 75%, and another with an atomic mass of 37 u and abundance of 25%. Calculate the average atomic mass of the element.

Solution:

Average atomic mass = (mass of isotope 1 × abundance) + (mass of isotope 2 × abundance)

$$= (35 \text{ u} \times 0.75) + (37 \text{ u} \times 0.25)$$

$$= 26.25 + 9.25$$

$$= 35.5 \text{ u}$$

Question 3: An isotope is represented as ^{14}C . What do the numbers and letter indicate?

Answer:

^{14}C indicates a carbon isotope with a mass number of 14 (sum of protons and neutrons). The letter 'C' is the chemical symbol for carbon.

Question 4: How many neutrons are in a ^{238}U isotope?

Solution:

Number of neutrons = Atomic mass number - Atomic number

Uranium's atomic number = 92 (number of protons)

Neutrons = $238 - 92 = 146$ neutrons

Question 5: Explain how isotopes are used in radiocarbon dating.

Answer:

Radiocarbon dating uses the isotope ^{14}C , which is naturally present in organic materials. When an organism dies, it stops taking in ^{14}C , which then decays at a known rate (half-life of about 5730 years). By measuring the remaining ^{14}C in a sample and comparing it to the initial amount, scientists can estimate the time since death, allowing for age determination of archaeological and geological samples.
