

DILATIONS WITH ANSWERS Reference

dilations with answers are an essential topic in geometry, especially when studying similar figures and transformations. Understanding how dilations work, their properties, and how to solve related problems is crucial for students aiming to master geometry concepts. In this article, we will explore dilations with answers, providing clear explanations, step-by-step solutions, and practice problems to help you grasp the concept thoroughly.

What Are Dilations?

Dilations are a type of geometric transformation that enlarges or reduces a figure while maintaining its shape. The size of the figure changes, but its shape and the measures of corresponding angles remain unchanged. This transformation is also known as a similarity transformation because it produces similar figures.

Key Components of Dilations

- **Center of Dilation:** The fixed point from which the figure is enlarged or reduced.
- **Scale Factor (k):** A number that determines the degree of enlargement or reduction. If $|k| > 1$, the figure enlarges; if $0 < |k| < 1$, the figure reduces.

Properties of Dilations

Understanding the properties of dilations helps in solving problems efficiently:

- The image after dilation is similar to the original figure.
- The ratios of corresponding side lengths are equal to the scale factor.
- Angles are preserved; they are congruent in the original and dilated figures.
- The distance from the center of dilation to any point in the figure is scaled by $|k|$.

How to Perform a Dilation

Performing a dilation involves:

- Identifying the center of dilation.
- Determining the scale factor.

- Applying the scale factor to each point of the figure relative to the center.

Common Dilation Problems with Answers

Let's explore some example problems with detailed solutions to clarify how dilations work.

Example 1: Basic Dilation

Problem:

A triangle has vertices at A(2, 3), B(4, 7), and C(6, 3). Perform a dilation with center at the origin (0,0) and scale factor $k = 3$. Find the coordinates of the dilated triangle.

Solution:

Since the center is at the origin, dilating each point involves multiplying the x and y coordinates by 3.

- For A(2, 3):

$$A' = (2 \times 3, 3 \times 3) = (6, 9)$$

- For B(4, 7):

$$B' = (4 \times 3, 7 \times 3) = (12, 21)$$

- For C(6, 3):

$$C' = (6 \times 3, 3 \times 3) = (18, 9)$$

Answer:

The dilated triangle has vertices at A'(6, 9), B'(12, 21), and C'(18, 9).

Example 2: Dilation with a Different Center

Problem:

A rectangle has vertices at P(2, 2), Q(6, 2), R(6, 4), and S(2, 4). It is dilated with center at point C(4,

3) and scale factor $k = 0.5$. What are the coordinates of the dilated rectangle?

Solution:

For a dilation with a center other than the origin, the process involves:

- Drawing the line from the center C to each point.
- Finding the vector from C to each point.
- Multiplying this vector by the scale factor.
- Adding the scaled vector back to the center to get the new point.

Calculations:

- For P(2, 2):

Vector from C to P: $(2 - 4, 2 - 3) = (-2, -1)$

Scaled vector: $(-2 \times 0.5, -1 \times 0.5) = (-1, -0.5)$

New point P': $(4 + (-1), 3 + (-0.5)) = (3, 2.5)$

- For Q(6, 2):

Vector: $(6 - 4, 2 - 3) = (2, -1)$

Scaled: $(2 \times 0.5, -1 \times 0.5) = (1, -0.5)$

P': $(4 + 1, 3 + (-0.5)) = (5, 2.5)$

- For R(6, 4):

Vector: $(6 - 4, 4 - 3) = (2, 1)$

Scaled: $(2 \times 0.5, 1 \times 0.5) = (1, 0.5)$

R': $(4 + 1, 3 + 0.5) = (5, 3.5)$

- For $S(2, 4)$:

Vector: $(2 - 4, 4 - 3) = (-2, 1)$

Scaled: $(-2 \times 0.5, 1 \times 0.5) = (-1, 0.5)$

S' : $(4 + (-1), 3 + 0.5) = (3, 3.5)$

Answer:

The dilated rectangle has vertices at $P'(3, 2.5)$, $Q'(5, 2.5)$, $R'(5, 3.5)$, and $S'(3, 3.5)$.

Example 3: Finding the Scale Factor

Problem:

A triangle has sides of lengths 6, 8, and 10 units. After a dilation with center at the origin, the image has sides measuring 12, 16, and 20 units. What is the scale factor?

Solution:

Since the side lengths are scaled proportionally, we can find the scale factor by dividing the length of a side in the image by the corresponding side in the original figure.

Using the side with length 6:

$$k = 12 / 6 = 2$$

Check with another side:

$$k = 16 / 8 = 2$$

And with the longest side:

$$k = 20 / 10 = 2$$

Answer:

The scale factor is 2.

Practice Problems with Answers

Test your understanding with these problems:

-

A pentagon has vertices at (1, 2), (3, 4), (5, 2), (4, 0), and (2, 0).

It is dilated with center at (0, 0) and scale factor 0.5.

What are the new vertices?

Solution: Multiply each coordinate by 0.5:

$$(1, 2) \rightarrow (0.5, 1)$$

$$(3, 4) \rightarrow (1.5, 2)$$

$$(5, 2) \rightarrow (2.5, 1)$$

$$(4, 0) \rightarrow (2, 0)$$

$$(2, 0) \rightarrow (1, 0)$$

Answer: The vertices are at (0.5, 1), (1.5, 2), (2.5, 1), (2, 0), and (1, 0).

-

A triangle has vertices at (0, 0), (4, 0), and (2, 3).

After a dilation with center at (1, 1), the image has vertices at (0.5, 0.5), (4.5, 0.5), and (2.5, 3.5).

Find the scale factor.

Solution: Use the distance from the center to a point:

For original point (0, 0):

$$\text{Vector from center (1, 1): } (-1, -1), \text{ length} = \sqrt{(-1)^2 + (-1)^2} = \sqrt{2} \approx 1.414$$

For image point (0.5, 0.5):

$$\text{Vector: } (0.5 - 1, 0.5 - 1) = (-0.5, -0.5), \text{ length} = \sqrt{(-0.5)^2 + (-0.5)^2} = \sqrt{0.5} \approx 0.707$$

The ratio: $0.707 / 1.414 = 0.5$

Answer: The scale factor is 0.5.

Dilations with answers are a fundamental topic in geometry that students often encounter during their study of transformations. Understanding dilations is key to grasping how figures can be scaled proportionally from a fixed point, known as the center of dilation. This concept not only deepens comprehension of geometric transformations but also lays the groundwork for more advanced topics such as similarity, ratios, and coordinate geometry. In this article, we will explore the concept of dilations thoroughly, breaking down definitions, properties, methods of solving dilation problems, and providing step-by-step answers to typical questions.

Understanding Dilations in Geometry

Dilations are a type of similarity transformation that produce an image scaled proportionally from the original figure. Unlike translations or rotations, dilations change the size of a figure but preserve its shape. The key idea involves a fixed point called the center of dilation and a scale factor that determines how much larger or smaller the image will be relative to the original.

Definition of a Dilation

A dilation is a transformation that maps every point (P) in a figure to a point (P') such that:

- There exists a fixed point (C) called the center of dilation.
- The point (P') lies on the line segment (CP) .
- The distance (CP') is equal to $(k \times CP)$, where (k) is the scale factor.

Mathematically, if (C) is the center and (P) is a point on the original figure, then:

$$P' = \text{the point on the line } CP \text{ such that } CP' = k \times CP$$

\]

- If $k > 1$, the dilation enlarges the figure.
- If $k = 0$
- If $k = 1$, the figure remains unchanged (identity transformation).
- If k is negative, the figure is reflected across the center before being scaled.

Properties of Dilations

- Shape Preservation: The shape of the figure remains the same; only the size changes.
- Proportionality: Corresponding lengths are proportional by the scale factor.
- Center of Dilation: All lines from the center to corresponding points are collinear.
- Parallelism: Corresponding sides are parallel in similar figures.
- Area change: The area of the dilated figure is scaled by k^2 .

How to Perform a Dilation: Step-by-Step

To perform a dilation, follow these steps:

- Identify the center of dilation C .
- Find the scale factor k .
- For each point P on the original figure, draw the line segment CP .
- Measure the distance CP .
- Mark the point P' along CP such that $CP' = k \times CP$.
- Repeat for all vertices or points of the figure.
- Connect the dilated points to form the image.

Solving Dilation Problems: Common Techniques and Examples

Problems involving dilations often ask you to find missing coordinates, determine the scale factor, or verify similarity. Below, we explore common question types with detailed solutions.

Example 1: Finding the Coordinates of the Dilated Image

Question:

Given a triangle $\triangle ABC$ with vertices $A(2, 3)$, $B(4, 7)$, and $C(6, 3)$, and a center of dilation at $C(4, 5)$. The dilation scale factor is $k = 2$. Find the coordinates of the

dilated triangle $\triangle A'B'C'$.

Solution:

- Identify points:

- Original points:

- $A(2,3)$

- $B(4,7)$

- $C(6,3)$

- Center of dilation:

- $C_{\text{center}}(4,5)$

- Scale factor:

- $k=2$

- Calculate dilated points:

Each point $P(x, y)$ is mapped to $P'(x', y')$ such that:

[

$$x' = x_{\{C\}} + k(x - x_{\{C\}})$$

]

[

$$y' = y_{\{C\}} + k(y - y_{\{C\}})$$

]

- Find A' :

[

$$x_{\{A\}} = 2, \quad y_{\{A\}} = 3$$

\\

\\

$$x'_{\{A\}} = 4 + 2(2 - 4) = 4 + 2(-2) = 4 - 4 = 0$$

\\

\\

$$y'_{\{A\}} = 5 + 2(3 - 5) = 5 + 2(-2) = 5 - 4 = 1$$

\\

\\

$$A'(0, 1)$$

\\

- Find \\(B' \\):

\\

$$x_{\{B\}} = 4, \quad y_{\{B\}} = 7$$

\\

\\

$$x'_{\{B\}} = 4 + 2(4 - 4) = 4 + 0 = 4$$

\\

\\

$$y'_{\{B\}} = 5 + 2(7 - 5) = 5 + 2(2) = 5 + 4 = 9$$

\\

\[

$B'(4, 9)$

\]

- Find (C') :

\[

$$x_{\{C\}} = 6, \quad y_{\{C\}} = 3$$

\]

\[

$$x'_{\{C\}} = 4 + 2(6 - 4) = 4 + 2(2) = 4 + 4 = 8$$

\]

\[

$$y'_{\{C\}} = 5 + 2(3 - 5) = 5 + 2(-2) = 5 - 4 = 1$$

\]

\[

$C'(8, 1)$

\]

Answer:

The dilated triangle $(\triangle A'B'C')$ has vertices:

- $(A'(0, 1))$

- $(B'(4, 9))$

- $(C'(8, 1))$

Example 2: Determining the Scale Factor

Question:

A square with vertices $(1, 1)$, $(1, 3)$, $(3, 3)$, and $(3, 1)$ is dilated with respect to the center $(2, 2)$. The resulting square has side length 6. Find the scale factor.

Solution:

- Calculate original side length:

[

$\text{Original side length} = \text{distance between } (1,1) \text{ and } (1,3)$

]

[

$\text{Distance} = |3 - 1| = 2$

]

- Determine the scale factor:

- Original side length = 2

- New side length = 6

[

$k = \frac{\text{new side length}}{\text{original side length}} = \frac{6}{2} = 3$

]

Answer:

The scale factor is 3.

Features and Pros/Cons of Dilations

Features:

- Shape similarity: Figures are similar after dilation.
- Flexible scale: Can enlarge or reduce figures.
- Preserves angles: No distortion of shape.
- Applications: Used in art, engineering, and computer graphics.

Pros:

- Simple to perform once the center and scale factor are known.
- Fundamental for understanding similarity and proportional reasoning.
- Useful in real-world scaling problems.

Cons:

- Requires precise measurement of distances.
- Negative scale factors can introduce reflections, which may confuse beginners.
- Not applicable for figures requiring complex transformations involving rotation or translation unless combined.

Common Mistakes and Tips

- Misidentifying the center: Always confirm the center of dilation before calculations.
- Incorrect scale factor application: Remember that the scale factor multiplies the distance from the center.
- For negative scale factors: Account for reflection; the point is scaled in the opposite direction.
- Coordinate calculations: Use the correct formula and double-check arithmetic.

Conclusion

Dilations with answers form an essential aspect of understanding geometric transformations. They help illustrate how figures can be scaled proportionally, maintaining their shape while adjusting their size. Mastery of dilations involves understanding the role of the center, scale factor, and the ability to perform precise calculations. Whether solving for new coordinates, demonstrating similarity, or applying dilation in real-world contexts, the concepts covered here provide a solid foundation.

Practice with diverse problems enhances intuition and accuracy, making dilations an accessible and powerful tool in the study of geometry.

Question What is a dilation in geometry? A dilation is a transformation that produces an image that is the same shape as the original but is resized either bigger or smaller, based on a certain scale factor, with respect to a fixed point called the center of dilation. How do you perform a dilation of a point with a given scale factor? To dilate a point, multiply the distance from the center of dilation to the point by the scale factor. The dilated point is located along the line connecting the center to the original point, at the scaled distance. What is the difference between a dilation with a scale factor greater than 1 and less than 1? A scale factor greater than 1 results in an enlargement (making the figure bigger), while a scale factor less than 1 results in a reduction (making the figure smaller). Is a dilation a similarity transformation? Yes, a dilation is a type of similarity transformation because it preserves the shape of the figure while changing its size proportionally. Can a dilation change the shape of a figure? No, a dilation only changes the size of the figure, not its shape. The resulting image is similar to the original figure. What is the formula for performing a dilation with respect to a point (center) using a scale factor? If the center of dilation is at point $C(x_c, y_c)$, and a point $P(x, y)$ is being dilated with scale factor k , then the image P' is given by: $P' = (x_c + k(x - x_c), y_c + k(y - y_c))$.
