Dna and heredity unit answer key bing

dna and heredity unit answer key bing is a valuable resource for students and educators seeking reliable information and practice materials related to genetics. Understanding the fundamental concepts of DNA and heredity is crucial for grasping how traits are inherited and how genetic information is stored, transmitted, and expressed in living organisms. This comprehensive guide aims to provide an in-depth overview of the key topics covered in the DNA and Heredity unit, along with tips on utilizing answer keys effectively for learning and assessment purposes.

Understanding DNA and Its Role in Heredity

What Is DNA?

Deoxyribonucleic acid (DNA) is the hereditary material in almost all living organisms. It contains the instructions necessary for the growth, development, functioning, and reproduction of cells. DNA is

composed of two strands forming a double helix structure, made up of nucleotides that include a sugar, a phosphate group, and a nitrogenous base.

Structure of DNA

The structure of DNA is fundamental to its function. It consists of:

- **Nucleotides:** The building blocks of DNA, each containing a nitrogenous base, a sugar (deoxyribose), and a phosphate group.
- **Nitrogenous Bases:** Four types?adenine (A), thymine (T), cytosine (C), and guanine (G). These bases pair specifically (A with T, C with G) forming base pairs.
- **Double Helix:** The two strands of DNA twist around each other, providing stability and allowing for replication.

DNA Replication

DNA replication is the process by which a cell copies its DNA before cell division. This ensures that each new cell receives an identical set of genetic information. Key steps include:

- Unwinding the double helix.
- Complementary base pairing.
- Formation of two identical DNA molecules.

Genetics and Heredity

What Is Heredity?

Heredity is the transmission of genetic traits from parents to offspring. It explains why offspring resemble their parents and how genetic variation occurs within populations.

Genes and Alleles

Genes are segments of DNA that code for specific traits. Variations of a gene are called alleles, and they influence traits such as eye color, height, and blood type.

Dominant and Recessive Traits

Traits are inherited through dominant and recessive alleles:

- **Dominant:** An allele that masks the effect of a recessive allele when present.
- **Recessive:** An allele that is masked by a dominant allele and only expressed when two recessive alleles are present.

Genotype and Phenotype

- **Genotype:** The genetic makeup of an organism (e.g., AA, Aa, aa).
- **Phenotype:** The observable traits resulting from the genotype (e.g., blue eyes, tall stature).

Q3. Which hormone primarily increases blood glucose levels?

- a) Insulin
- b) Glucagon
- c) Thyroxine
- d) Calcitonin

Answer: b) Glucagon

Explanation: Glucagon, secreted by pancreatic alpha cells, stimulates the liver to break down glycogen into glucose, raising blood glucose levels during fasting or hypoglycemia.

Q4. In response to dehydration, the kidneys primarily:

- a) Excrete more water
- b) Retain water and concentrate urine
- c) Increase blood volume through vasodilation

d) Secrete aldosterone to decrease sodium reabsorption

Answer: b) Retain water and concentrate urine
