Areva distance relays operate on the impedance measurement principle. The relay measures the apparent impedance (Z) between the relay location and the fault point, calculated using voltage and current signals:

$$Z = \frac{V}{I}$$

Where:

- V is the measured voltage
- I is the measured current

Protection Zones and Settings

Distance relays typically define multiple zones:

- Zone 1: Immediate protection, usually covering 80-90% of line length
- Zone 2: Back-up protection, covering an additional 50-100% of the line
- Zone 3: Out-of-step or long-line faults, providing extended coverage

These zones are configured via the relay's settings, which are detailed in the manual.

Configuration and Setting Procedures

Step 1: Preliminary Checks

- Verify relay specifications match system parameters
- Ensure proper wiring and connections
- Check power supply and communication interfaces

Step 2: Setting Protection Parameters

- Define zone reach settings based on line length and impedance
- Adjust time delay settings for each zone
- Configure sensitivity thresholds and pickup currents
- Set directional elements if needed

Step 3: Calibration and Testing

- Use test sets or secondary injection to simulate faults
- Confirm relay operation within designated zones
- Adjust settings if necessary to optimize performance

Installation Guidelines

- Mount relay in a suitable panel or cabinet, ensuring adequate ventilation
- Maintain proper grounding and shielding
- Follow manufacturer's instructions for wiring and connections
- Use appropriate communication protocols for integrated protection schemes
