Understanding Work, Energy, and Power in Physics

In physics, work, energy, and power are interconnected concepts that describe how objects move and interact under various forces. Mastering these ideas is essential for solving problems related to mechanics, thermodynamics, and other branches of physics.

What Is Work in Physics?

Work occurs when a force causes displacement of an object in the direction of the force. It is mathematically expressed as:

$$\text{Work (W)} = \text{Force (F)} \times \text{Displacement (d)} \times \cos(?)$$

where ? is the angle between the force and displacement vectors.

Key points:

- Work is only done when there is displacement in the direction of the applied force.
- Work can be positive, negative, or zero depending on the direction of force and displacement.

What Is Energy?

Energy is the capacity to do work. It exists in various forms, including kinetic energy, potential energy, thermal energy, and more. The two primary types relevant to mechanics are:

- **Kinetic Energy (KE):** Energy possessed by a moving object.
- **Potential Energy (PE):** Stored energy due to an object's position or configuration.

Kinetic Energy Formula:

$$\text{- KE} = \frac{1}{2} m v^2$$

where m is mass and v is velocity.

Potential Energy Formula (due to gravity):

$$\text{- PE} = m g h$$

where g is acceleration due to gravity and h is height.

What Is Power?

Power measures how quickly work is done or energy is transferred. It is defined as:

$$\text{- Power (P)} = \text{Work done} / \text{Time taken}$$

The SI unit of power is the watt (W), where 1 watt equals 1 joule per second.

$$\text{KE} = \frac{1}{2} m v^2 = \frac{1}{2} \times 2 \text{ kg} \times (5 \text{ m/s})^2 = 1 \times 25 = 25 \text{ Joules}$$

Sample Problem 3: Potential Energy at a Height

Question:

An object of mass 10 kg is lifted to a height of 15 meters. What is its potential energy?

Answer Key:

$$\text{PE} = m g h = 10 \text{ kg} \times 9.8 \text{ m/s}^2 \times 15 \text{ m} = 10 \times 9.8 \times 15 = 1470 \text{ Joules}$$

Sample Problem 4: Power Used in Doing Work

Question:

A worker lifts a 100 kg load to a height of 3 meters in 5 seconds. Calculate the power exerted.

Understanding Work, Energy, and Power in Physics

Defining Work in Physics

Work, in the realm of physics, is defined as the process of energy transfer when a force causes an object to move in the direction of the applied force. Mathematically, work (W) is expressed as:

$$W = F \times d \times \cos\{\theta\}$$

where:

- F is the magnitude of the force applied,
- d is the displacement of the object,
- θ is the angle between the force vector and displacement vector.

Work is a scalar quantity, measured in joules (J). An important aspect is that work is only done when there is displacement and a component of force in the direction of that displacement. If either displacement is zero or the force is perpendicular to the displacement, no work is done.

Real-world examples:

- Pushing a box across the floor (positive work).
- Holding a heavy object stationary (no work done since displacement is zero).

- Lifting an object vertically (positive work against gravity).

Understanding Energy

Energy, the capacity to do work, exists in various forms such as kinetic energy, potential energy, thermal energy, and more. The focus in basic physics education often centers on kinetic and potential energy:

- Kinetic Energy (KE): Energy possessed by a body due to its motion, given by:

$$KE = \frac{1}{2}mv^2$$

where m is mass and v is velocity.

- Potential Energy (PE): Stored energy due to position or configuration, for example, gravitational potential energy:

$$PE = mgh$$

where g is acceleration due to gravity and h is height above a reference point.

The law of conservation of energy states that energy cannot be created or destroyed, only transformed from one form to another. Classroom work often involves calculating energy transformations, understanding conservation, and solving problems related to energy efficiency.

Power: The Rate of Doing Work

Power quantifies how quickly work is done or energy is transferred over time. It is expressed as:

$$P = \frac{W}{t}$$

where:

- P is power in watts (W),
- W is work in joules,
- t is time in seconds.

In practical terms, power indicates the rate at which a machine or person performs work. For

example, a car engine's power rating reflects how much work it can perform per unit time.

Applications:

- Comparing the efficiency of different machines.
- Analyzing athletic performance in sports science.
- Understanding energy consumption in electrical devices.

Solution:

- Force $(F = 50 \text{ N})$
- Displacement $(d = 5 \text{ m})$
- Assuming force is in the direction of movement $(\theta = 0^\circ)$

$$W = F \times d \times \cos\{0^\circ\} = 50 \times 5 \times 1 = 250 \text{ J}$$

Answer key notes: The work done is 250 joules, and since the surface is frictionless, no energy is lost to heat.

Example 2: Kinetic and Potential Energy

Problem: A 2 kg ball is dropped from a height of 10 meters. Assuming negligible air resistance, calculate its speed just before hitting the ground.

Solution:

- Initial potential energy:

$$PE = mgh = 2 \times 9.8 \times 10 = 196 \text{ J}$$

- By conservation of energy, kinetic energy just before impact:

$$KE = PE = 196 \text{ J}$$

- Solving for velocity:

$$KE = \frac{1}{2}mv^2 \Rightarrow v = \sqrt{\frac{2KE}{m}} = \sqrt{\frac{2 \times 196}{2}} = \sqrt{196} = 14 \text{ m/s}$$

Answer key notes: The ball's speed just before impact is 14 m/s.
