Materials Required

- Beakers or shallow dishes
- Water
- Thermometer
- Timer/stopwatch
- Humidifier or desiccant (optional)
- Access to different temperature environments

Procedure

- Fill beakers with equal amounts of water.
- Place the beakers in different environments with varying temperatures or expose them to different surface areas (e.g., using different sizes or shapes of dishes).
- Record initial water levels.
- Start the timer and note the water level at regular intervals (e.g., every 30 minutes).
- Observe how factors like temperature and surface area influence the rate of evaporation.

Expected Outcome

An increase in temperature or surface area typically leads to a higher rate of evaporation, demonstrating the effect of these variables.

2. Measurement of the Acceleration Due to Gravity Using a Pendulum

Objective

To determine the acceleration due to gravity (g) using a simple pendulum.

Materials Required

- String (about 1-2 meters)
- Rigid support stand or hook
- Small dense object (bob) like a metal washer
- Stopwatch
- Meter scale or ruler

Procedure

- Attach the bob to one end of the string and suspend it from the support stand.
- Measure the length (L) of the pendulum from the point of suspension to the center of the bob.
- Pull the pendulum back to a small angle (less than 15°) and release without pushing.
- Use the stopwatch to measure the time (T) for 20 oscillations.
- Calculate the period (T?) of one oscillation: $T? = T / 20$.
- Use the formula: $g = (4\pi^2 L) / T^2$ to compute the acceleration due to gravity.

Notes

Ensure the angle of displacement is small for accurate results and repeat the experiment for consistency.

3. Exploring Ohm's Law through Electrical Circuits

Objective

To verify Ohm's Law by studying the relationship between voltage, current, and resistance.

Materials Required

- Battery or power supply
- Resistors of known resistance
- Ammeter (for measuring current)
- Voltmeter (for measuring voltage)
- Connecting wires
- Switch

Procedure

- Connect the resistor into the circuit with the power supply, ammeter, and voltmeter as per the circuit diagram.
- Close the switch to allow current flow and record the voltage across the resistor and the current through it.
- Vary the voltage by adjusting the power supply and record the corresponding current for each voltage level.
- Plot a graph of voltage (V) versus current (I).
- Calculate the resistance using $R = V / I$ and verify if it remains constant.

Outcome

A linear V-I graph confirms Ohm's Law, indicating that voltage is directly proportional to current for the resistor.

4. Investigating Properties of Acids and Bases

Objective

To identify acids and bases using indicators and observe their properties.

Materials Required

- Common acids (e.g., vinegar, lemon juice)
- Common bases (e.g., baking soda solution, soap solution)

5. Study of Simple Machines and Mechanical Advantage

Objective

To understand how simple machines reduce effort and increase mechanical advantage.

Materials Required

- Inclined plane
- Pulley system
- Rope and weights
- Force meter or spring balance

Procedure

- Set up the inclined plane and record the effort needed to move a load up the plane.
- Calculate the mechanical advantage: $MA = \text{load force} / \text{effort force}$.
- Repeat with different setups, such as using pulleys, to observe changes in effort and advantage.

Expected Outcomes

Simple machines help reduce the effort needed to move loads, illustrating the principle of mechanical advantage.
