Answer:

Data validation is a feature that restricts the type of data or the values that users can enter into a cell. It helps maintain data integrity and reduces errors.

Steps to apply data validation:

- Select the cell(s) where validation is needed.
- Go to the Data tab.
- Click Data Validation.
- In the Settings tab, choose the validation criteria, such as:
 - Whole number between specific values
 - List of allowed entries
 - Date within a range
 - Text length
- Optionally, set input messages and error alerts to guide users.

Example: Creating a dropdown list of departments for selection.

4. Explain how VLOOKUP works and provide a typical use case.

Answer:

VLOOKUP (Vertical Lookup) searches for a specific value in the first column of a table and returns a value in the same row from a specified column.

Syntax:

`=VLOOKUP(lookup_value, table_array, col_index_num, [range_lookup])`

- `lookup_value`: the value to search for
- `table_array`: the range containing data
- `col_index_num`: the column number to retrieve data from
- `[range_lookup]`: TRUE for approximate match, FALSE for exact match

Use case:

Suppose you have an employee ID and want to find the employee's name:

`=VLOOKUP(A2, B2:D100, 2, FALSE)`

This searches for the ID in column B and returns the corresponding name from column C.

5. How can IF statements be combined with other functions to perform complex data analysis?

Answer:

IF functions are logical statements that perform different actions based on whether a condition is TRUE or FALSE. Combining IF with functions like AND, OR, or nested IFs allows complex decision-making.

Example:

To categorize sales as "High" or "Low" based on a threshold:

`=IF(Sales >= 1000, "High", "Low")`

For multiple criteria:

`=IF(AND(Sales >= 1000, Region = "North"), "Priority", "Standard")`

Nested IFs can handle multiple conditions, such as:

```
=IF(Sales >= 1000, "High", IF(Sales >= 500, "Medium", "Low"))
```
